Name

CHX-Endo 2%
Cleaning solution
For dental use only

Composition

Solution contains chlorhexidine digluconate, surfactant, purified water

Indications

Cleaning and germ reduction of contaminated root canal instruments during endodontic treatment.

Contra-indications

Allergy to chlorhexidine digluconate or any of the ingredients

Side-effects

When used correctly, none known

Mode of application

Fill appropriate container – e.g. interim stand for the endofiles – with CHX-Endo 2% and cover with the corresponding sponge. The endofiles, drills etc. used during treatment are deposited here and at the same time cleaned through contact with the solution.

The detergents in the solution ensure rapid and complete removal of residual dentin, smear layers and other organic residues on the instruments.

Germ numbers of most undesirable endobacteria and fungi are also greatly reduced by virtue of the additional antimicrobial effect of chlorhexidine on these germs.

Additional rinsing is not necessary. The endo-instruments can be reused directly during treatment.

After treatment, the non-disposable instruments and containers used must be processed as specified (cleaning, disinfection, sterilization etc.).

Further notices

Products containing chlorhexidine must not be mixed with products containing sodium hypochlorite to prevent formation of a reddish-brown low-solubility precipitate.

Store out of the reach of children

Shelf life

CHX-Endo 2% should not be used after the expiry date

Administrative form and package sizes

50 ml solution
200 ml solution
500 ml solution

Date of revision

July 2010
